

## Insightix NAC

*Insightix NAC delivers stateful network access control, ensuring that only authorized and compliant devices are allowed to access and operate on the enterprise network.*

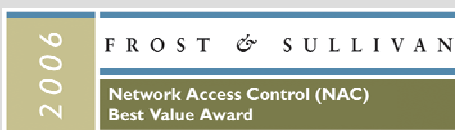

### Insightix NAC Features

- > **Real-Time Device Detection** – provides complete and real-time contextual network knowledge about the state of the devices on the network.
- > **Network-wide Policy Enforcement** – performs policy checks on all devices, not just Windows-based machines.
- > **Unique Blocking and Quarantine Techniques** – unauthorized devices are not granted access to any portion of the network. Quarantined devices are shielded from other network and quarantined devices without relying on switch integration.

### Insightix NAC Benefits

- > **Easy & Fast Implementation** – is completely agentless and can be rolled out in a matter of hours without any extensive deployment efforts.
- > **Full Network Coverage** – applies network access controls to all devices on the network.
- > **Low Total Cost-of-Ownership** – there is no need to implement specialized hardware or replace existing network equipment.

### Award Winning NAC Solution

Network access control (NAC) has created high expectations across the IT security industry. Numerous approaches for the deployment of NAC have been initiated, including various attempts at the standardization of technologies and architectures. At the same time, many vendors are trying to gain exposure by jumping on the NAC bandwagon with products that appear to provide NAC-like features. The currently available approaches to NAC are still expensive propositions that require network re-architecture and are based on a complex set of bypassable technologies.

### Insightix NAC – Stateful Network Access Control

Insightix NAC delivers stateful network access control, ensuring that only authorized and compliant devices are allowed to access and operate on the enterprise network.

Insightix NAC utilizes agentless Stateful Network Detection technology to maintain complete contextual information about the state of the entire network along with unique blocking and quarantine techniques that remove any dependencies on switches.

Insightix NAC simplifies the rollout of network access controls. Insightix NAC is agentless and does not require network changes, specialized software or hardware or extended deployment efforts.

### Real-Time Device Detection

Insightix NAC leverages Insightix's powerful Stateful Network Detection technology to maintain complete, accurate and real-time contextual knowledge about the state of the devices on the enterprise LAN. Insightix's Stateful Network Detection technology automates the real-time identification, profiling (capabilities and properties) and location of all of the devices residing on the enterprise network.

Based on the wealth of contextual IT infrastructure information gathered, Insightix NAC enables IT professionals to easily baseline their networks and authorize the devices that are permitted to access and operate on their networks.

Once activated, Insightix NAC performs real-time device detection and authorization enforcement. Any device not authorized to operate on the enterprise network is denied connectivity as it attempts to access to the network.

### Network-wide Policy Enforcement

As an authorized device attempts to access the enterprise network, Insightix NAC immediately isolates the device using Insightix's patent-pending Quarantine Silo technology by shielding it from other network devices while Insightix NAC performs posture validation checks.

Using a rule-based policy engine, IT professionals can easily define the posture validation checks that are performed by Insightix NAC. Examples of these checks include checks of Windows-based operating systems to verifying the service pack level, presence of certain operating system patches, open network services and installation and activation of anti-virus software.

Insightix's Quarantine Silo technology ensures that network access is not granted to an authorized device until it successfully passes the network access control posture validation checks.

### Continuous Network Monitoring

Insightix NAC constantly monitors the state of the network and identifies in real-time any changes made to the profile of devices that are authorized to operate on the network. When a profile change is detected, Insightix NAC immediately denies network access from the device.

Insightix NAC ensures that the properties of an authorized device, such as the MAC address, are not abused in order to prevent an unauthorized device masquerading as an authorized device.

*"By integrating proven asset discovery technology with real-time network access control, Insightix NAC offers an appealing solution for companies looking to implement NAC without exceed budget or implementation expectations."*

Rob Ayoub  
Network Security Analyst  
Frost & Sullivan

*"Insightix removes the complexities commonly associated with network access controls by simplifying the process to a natural extension of its already extensive network discovery capabilities."*

Dan Yachin  
Research Director  
IDC

### About Insightix

Insightix develops stateful IT visibility and network access control solutions. Insightix's solutions are agentless, provide full network coverage and deliver an immediate return-on-investment for network security, IT operations and regulation compliance. Insightix solutions are simple to use and overcome the technical limitations of existing solutions.

Insightix customers include prominent companies in the banking, retail, media, transportation, manufacturing, education and additional industries. Insightix's investors include SoftBank Capital, Blumberg Capital, Quest Software (NASDAQ:QSFT) and several technology veterans.
