

Insightix Visibility

Insightix Visibility delivers complete, accurate and real-time network information, providing an enterprise with stateful visibility of its entire IT infrastructure.

Insightix Visibility Features

- > **Complete IT Asset Discovery** – delivers a comprehensive inventory of every device on the network, including firewalled, unmanaged and virtual devices, and provides location information and a full list of associated properties.
- > **Accurate Network Topology Map** – maps the entire physical network topology, including all devices, such as workstations, servers, printers, wireless access points, VoIP phones, switches, routers and more
- > **Real-Time Change Detection** - continuously monitors the network for any changes made to the network and/or any of the devices on the network.

Insightix Visibility Benefits

- > **Cost Savings** – provides on-demand access to network information for IT professionals to complete routine IT tasks that were previously time consuming and relied on manual input.
- > **Agentless** – obtains critical network information without the deployment of software agents.
- > **Rapid Deployment** – is installed and generates results in a matter of hours.

An enterprise network is a complex and a dynamic environment that hosts a variety of devices, such as workstations, servers, printers, wireless access points, VoIP phones, switches, routers and more. Despite this, few enterprises maintain an up-to-date inventory and documentation of the devices on their networks. The reality is that devices are constantly added to the network without the knowledge of the enterprise's IT staff.

Insightix Visibility – Stateful IT Visibility

A full understanding of the devices operating on the network is an absolute must for managing and securing the network. Logically, it is impossible to manage or secure an entire network with only partial network knowledge. Simply, how can you manage or secure a network against devices that you don't know where they are or even exist?

Insightix Visibility obtains a complete inventory of all network devices, including firewalled, unmanaged and virtual devices, and provides location information and a full list of associated properties. Insightix Visibility also generates an accurate physical network topology map of the entire IT infrastructure.

The contextual information obtained by Insightix Visibility allows IT professionals to easily baseline their networks and successfully plan a range of critical IT initiatives, ensuring they are accurately deployed across their entire IT infrastructures.

- > **Network Access Control** – Insightix Visibility automates the identification and location of all devices residing on the network in preparations for the deployment of a NAC system. By profiling all devices connected to the network, Insightix Visibility identifies devices that are not compatible with 802.1x and related standards, unmanageable, not part of the Windows Domain or unknown to the enterprise. By identifying these devices in real-time, Insightix Visibility simplifies and accelerates the deployment of a NAC system.

- > **Patch Management** – Insightix Visibility identifies devices operating on the network that are not patched by the enterprise's patch management solution. This allows IT staff to quickly identify and control unpatched devices. Insightix Visibility facilitates that all devices are compliant with the enterprise patch policy, lowering the overall exposure to viruses, Trojans and Malware.
- > **Intrusion Detection/Prevention** – Insightix Visibility provides the contextual information for intrusion detection/prevention systems to improve performance by giving an increased understanding of the events and reducing the amount of false negatives and false positives generated.
- > **Regulation Compliance** – Insightix Visibility maintains the complete inventory of IT assets connected to the network, including historical usage information, helping enterprises satisfy a range of government regulations, such as Sarbanes-Oxley.
- > **Vulnerability Assessment** – Insightix Visibility provides vulnerability assessment systems with a complete target list of devices according to various parameters, such as OS and running network services. This reduces the time required by these systems to collect vulnerability data. Insightix Visibility eliminates the need for these systems to gather discovery-related information in a lengthy and incomplete manner.

Insightix Visibility offers additional value by significantly improving the response times to IT helpdesk inquiries, asset tracking, performance issues, policy violations and security events.

Stateful Network Detection Technology

Insightix Visibility is powered by Insightix's Stateful Network Detection technology. This patent-pending, agentless technology generates and maintains a real-time "state" of all devices connected to the network. Insightix's Stateful Network Detection technology enables Insightix Visibility to deliver complete IT visibility and full network coverage in real-time.

"Insightix (Visibility) can aid enterprise IT initiatives ranging from capacity planning to regulatory compliance, helping to mitigate risks and increase business value for almost every type of IT investment."

Michael Dortch
Director of IT Infrastructure Strategies
Robert Frances Group

"The software discovered all sorts of devices we didn't have documented on our infrastructure map...Insightix (Visibility) will likely be as beneficial to network and system operations as it is to the security department."

Cameron Sturdevant
Technical Director
eWeek

About Insightix

Insightix develops stateful IT visibility and network access control solutions. Insightix's solutions are agentless, provide full network coverage and deliver an immediate return-on-investment for network security, IT operations and regulation compliance. Insightix solutions are simple to use and overcome the technical limitations of existing solutions.

Insightix customers include prominent companies in the banking, retail, media, transportation, manufacturing, education and additional industries. Insightix's investors include SoftBank Capital, Blumberg Capital, Quest Software (NASDAQ:QSFT) and several technology veterans.
